American politics, admired for his intelligence, savvy, and strategic skill, and reviled for his shady manner and cutthroat tactics. Conrad Black, whose epic biography of FDR was widely acclaimed as a masterpiece, now separates the good in Nixon—his foreign initiatives, some of his domestic policies, and his firm political hand—from the sinister, in a book likely to generate enormous attention and controversy. Black believes the hounding of Nixon from office was partly political retribution from a lifetime's worth of enemies and Nixon's misplaced loyalty to unworthy subordinates, and not clearly the consequence of crimes in which he participated. Conrad Black's own recent legal travails, though hardly comparable, have undoubtedly given him an unusual insight into the pressures faced by Nixon in his last two years as president and the first few years of his retirement.

Many structures in the human body are named after Johannes Muller, one of the most respected anatomists and physiologists of the 19th century. Muller taught many of the leading scientists of his age, many of whom would go on to make trail-blazing discoveries of their own.

Among them were Theodor Schwann, who demonstrated that all animals are made of cells; Hermann Helmholtz, who measured the velocity of nerve impulses; and Rudolf Virchow, who convinced doctors to think of disease at the cellular level. This book tells Muller's story by interweaving it with those of seven of his most famous students. Muller suffered from depression and insomnia at the same time as he was doing his most important scientific work, and may have committed suicide at age 56. Like Muller, his most prominent

students faced personal and social challenges as they practiced cutting-edge science. Virchow was fired for his political activism, Jakob Henle was jailed for membership in a dueling society, and Robert Remak was barred from Prussian universities for refusing to renounce his Orthodox Judaism. By recounting these stories, Muller's Lab explores the ways in which personal life can affect scientists' professional choices, and consequently affect the great discoveries they make.
