Each segment of current produces a magnetic field like that of a long straight wire, and the total field of any shape current is the vector sum of the fields due to each segment. The formal statement of the direction and magnitude of the field due to each segment is called the Biot-Savart law.

Magnetism Section 1 Magnetic Fields, continued • Magnets are sources of magnetic fields. • Moving charges create magnetic fields. • magnetic domains: groups of atoms that all line up the same way and form small, magnetized regions within a material • Magnetic field lines are used to represent a magnetic field.

## Section 1: Magnets and Magnetic Fields

The magnetic fields of individual atoms balance one another in most materials. Those materials, such as copper and aluminum, are not magnetic. In some materials, including iron, nickel, and cobalt, atoms form larger groups called magnetic domains. The magnetic fields of all the atoms in a magnetic domain line up in the same direction.
