1 Soil is a thin layer of material on the Earth's surface in which plants have their roots. It is made up of many things, such as weathered rock and decayed plant and animal matter. Soil is formed over a long period of time. 2 Soil is the unconsolidated mineral or

Soils have four major components: (a) mineral matter, (b) organic matter, (c) air, and (d) water. Air and water occupy the pore spaces in soils. Pore spaces are the voids between the soil particles. Air and/or water occupy approximately half the volume of soil.

Sir

Soil chemistry is the interdisciplinary branch between soil sciences and chemistry and studies the chemical characteristics of soil. Soil is made up of the solid particles and water, air, microorganisms and plant roots contained upper layer of the earth's

Download File PDF Soil Science Lecture Notes

crust, which is caused by erosion of the rocky subsoil.

Soil Chemistry

Edaphology is concerned with the influence of soils on living things, particularly plants. It is one of two main divisions of soil science, the other being pedology. Edaphology includes the study of how soil influences humankind's use of land for plant growth as well as people's overall use

Download File PDF Soil Science Lecture Notes

of the land. General subfields within edaphology are agricultural soil science and environmental soil science. In Russia, edaphology is considered equivalent to pedology, but is recognized to have an applied
