Three-phase electric power is a common method of alternating current electric power generation, transmission, and distribution. It is a type of polyphase system and is the most common method used by electrical grids worldwide to transfer power. It is also used to power large motors and other heavy loads. A

The triple total power value is transmitted with only three or four lines, depending on whether the three-phase system is connected with or without a neutral line.

The neutral line carries the current, which is a result of the unbalanced three-phase system, i.e., the current value is difference between phases.
